

Fiber Cable Install- Town of Farmington

Farmington Residents,

The town has received numerous inquiries regarding the diggers hotline utility locating and the presence of utility crew working throughout the town. This work is associated with a Charter Communications underground fiber project. Charter Communications is installing a new fiber network throughout the community to increase and improve fiber internet service to our residents. This will also offer additional service provider options for our town residents.

This is not a town contracted project, nor is it town funded. The only town involvement in this work is approving the permit to allow them to work within the towns right of way (ROW). Typically, the ROW is 66' wide, usually measuring 33' from the center line of the road. This is the only area that the town has authorized them to work, not on any private property. We also do not specify where the pedestals are placed or underground vaults are installed. Charter Communications team has communicated that they will work with property owners for the best placement options.

If you have any questions or concerns, please feel free to contact the Charter Communications representative list below.
